

ICM Velocity Tomography of Galaxy Clusters

Renato Dupke & Joel Bregman
University of Michigan

- Why should we look for ICM bulk velocities?
 - Cosmology – Assumptions used to estimate mass and baryon fractions
 - Cluster Evolution – merging frequency, energetics, connection to X-ray substructures (cold fronts, plumes).
 - Discrepancy with lensing masses (e.g. A1689?, A2218 (Machacek et al. 2002)
 - We can nail down the evolutionary stage by comparing (Sb_e , T_e and V_r) to Num.+Hydro simulations of cluster mergers (e.g. Ricker 1998, 2002; Takizawa 2000; Roettiger et al. 1997, 1998; Burns 1999)

Simulations

e.g. Ricker 1998

How to measure it.

Gain Issues

ASCA GIS _ ~ 1500 km/s

SIS _ ~ 800 - 900 km/s

Chandra S3 _ ~ 300 - 500 km/s

EPIC MOS _ ~ 300 - 500 km/s?

How to Overcome Gain Concerns

Multiple
pointings
in the same
CCD location

Requires prior
knowledge of
velocity
distribution.

ASCA SIS SAMPLE

- 1-CCD mode, roughly centered on the cluster, $z < \sim 0.1$,
#cnts > 30 kcts/inst. Careful for sudden change of spectra.

RXJ0419.6+0225

1999 Aug 28 Exposure: 108697 s

04^h20^m00^s

04^h19^m30^s

04^h19^m00^s

A2052

in 24 Exposure: 80197 s

15^h17^m09^s

15^h16^m35^s

15^h16^m01^s

Gain Fluctuations

(Dotani et al.)

Best Cases

Abell 576 SIS0&1 froz nH

Redshifts are weighted by $\sigma_{\text{gain}}(t)$

RXJ0418 SIS0&1 froz nH

Redshifts are weighted by $\sigma_{\text{gain}}(t)$

Maybe

Abell 2052 SIS0&1 froz nH

Abell 3558 SIS0&1 froz nH

Worst

Abell 1650 SIS0&1 froz nH

Redshifts are weighted by $\sigma_{\text{gain}}(t)$

Abell 2244 SIS0&1 froz nH

Redshifts are weighted by $\sigma_{\text{gain}}(t)$

Discussion

- ✓ Results so far are consistent with a 10-20% of clusters having transients or rotational ICM bulk motions.
- ✓ ASCA sample is detecting the “tip of the iceberg”, i.e., the clusters that still have residual velocities on the order of several thousands km/s. Chandra and XMM archival studies will significantly improve the statistics of bulk motions in clusters and will provide “prior” knowledge about the velocity distribution that will be used to:
- ✓ provide the first “gain free” velocity maps with observations specifically tailored for velocity studies through multiple offset observations with Chandra and XMM and
- ✓ pave the way for “very” high resolution tomography by future spectrometers, such as the calorimeters on-board ASTRO-E2 and Constellation-X.

- Churazov et al. 1999
Temperature map shows high temperature region associated with NGC 4709
Infall of Subgroup?
- Test: Could we see this with the GIS? We find a significant (90% confidence)
 $\Delta z \rightarrow 1800\text{km/s}$ in the same direction as the optical studies
